

How Federal Clean Energy Tax Credits Benefit Nevada

Federal clean energy tax credits in the Inflation Reduction Act (IRA) are transforming the United States economy, already generating over \$360 billion in [project announcements](#) that have so far created 313,000 new jobs as of June 2024. Prior [modeling by Energy Innovation](#) showed IRA tax credits are projected to unleash billions in investment by 2030, increasing GDP up to \$200 billion and creating up to 1.3 million jobs nationally. Data from [Climate Power](#) shows that since the IRA's passage in August 2022, over \$14.5 billion in clean energy investments and over 20,000 new jobs have been announced in Nevada as of June 2024.

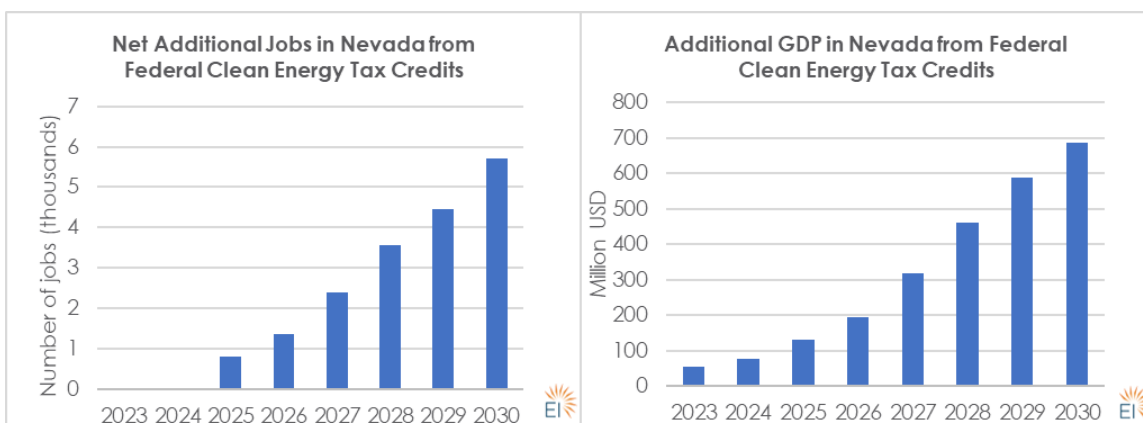

Energy Innovation used our free and open-source [Energy Policy Simulator](#) (EPS) to study potential state-level benefits on economic growth, jobs, and public health in Nevada from the IRA. We focus this analysis on clean electricity and clean vehicle tax credits, given the outsized impact of these tax credits on jobs and the economy.

This modeling finds these federal clean energy tax credits are projected to lower annual energy costs nearly \$72 per household for Nevada residents in 2030, prevent more than 100 early deaths from pollution through 2050, and cumulatively prevent more than 200 million metric tons of carbon dioxide through 2050 compared to the base case – equivalent to the emissions from 54 coal-fired power plants in one year.

Federal Clean Energy Tax Credits Add to GDP and Cut Household Energy Spending

Federal clean energy tax credits will increase clean energy deployment and electric vehicles sales in Nevada. These investments and their impacts are projected to increase Nevada's GDP by \$680 million in 2030. Higher clean energy deployment and decreased spending on gasoline are projected to reduce average annual household energy spending by \$72 per year in 2030 and a cumulative \$1.9 billion through 2050 across all households in Nevada.

Because more clean energy will be deployed with federal clean energy tax credits, Nevada is projected to gain more than 5,700 jobs in industries like manufacturing, construction, and sales in 2030.

Federal Clean Energy Tax Credits Are an Investment in Cleaner, Healthier Communities

IRA programs are expected to shift the U.S. energy system, replacing fuel combustion with clean energy. This transition will dramatically reduce greenhouse gas emissions along with harmful air pollution that causes asthma, respiratory illness, and premature death. Federal clean energy tax credits are projected to prevent 100 premature deaths and 26 asthma attacks in Nevada through 2050. The shift to clean energy is expected to have a particularly positive impact on the health of communities of color and low-income communities, which are disproportionately affected by vehicle and power plant pollution. Pollution reductions in neighboring states would avoid additional premature deaths and health impacts as well.

Avoided Health Impacts	in 2030	through 2050
Premature Mortality	2	100
Asthma Attacks	27	1,497
Nonfatal Heart Attacks	0	28
Hospital Admissions	0	22

Methodology

We identify incremental state clean electricity deployment by comparing two scenarios from [modeling by the National Renewable Energy Lab](#): the *Mid-case, nascent techs, current policies scenario* and the *No IRA, nascent techs, current policies scenario*. Comparing these two scenarios reveals the incremental clean electricity deployment from the IRA. We used the incremental clean electricity deployment to develop an IRA policy scenario for each state in the Energy Innovation EPS. We estimated clean vehicle tax credit impacts using a complementary model we developed. We combined the clean vehicle tax credits and clean electricity deployment to create an IRA scenario for Nevada and compared it against a case without the IRA to find outputs for changes in emissions, health impacts, statewide household savings, GDP, and jobs.
